AURUM KOREA

Website Comprehensive Audit & Build Brief

For Website Agent Implementation

April 11, 2026 | Version 2.0

Repository: github.com/tkjintl/aurum-website

Live: aurum-website-nu.vercel.app

Stack: React 19 + Vite 8 | Single-file (App.jsx = 91KB)

EXECUTIVE SUMMARY

This document is a comprehensive audit of the Aurum Korea website codebase (tkjintl/aurum-website) covering: language/font errors, factual inaccuracies, missing transaction infrastructure, and architectural improvements needed to bring the platform to production-ready state.

Critical Issue Count

Category	Issues	Priority
Korean Language Typos	16+ errors	CRITICAL/HIGH
Factual/Data Errors	7 errors	CRITICAL
Font/CSS Failures	7 issues	CRITICAL
Missing Transaction Pages	10 pages	CRITICAL/HIGH
Architecture Improvements	10 items	HIGH/MEDIUM

The website cannot launch in its current state. The Korean text contains numerous typos that would immediately destroy credibility with Korean investors. Key gold price figures are factually wrong. All custom fonts fail to load because no font imports exist. No transaction infrastructure exists (checkout, payment, confirmation, order history). The entire app is a single 91KB file.

1. KOREAN LANGUAGE & TYPO SCRUB

Complete inventory of Korean text errors found in App.jsx. Each must be corrected exactly as specified. Many errors appear to be consistent (e.g., 낙 used instead of 낮 in multiple locations), suggesting systematic input method issues.

Location	Current (Wrong)	Correct	Priority	Notes
WHY_GOLD / Education Intro	수청 년간	수천 년간	CRITICAL	Typo: 청 should be 천 (thousands). Appears 3+ times across multiple sections.
WHY_GOLD #3 Portfolio	주식·체권	주식·채권	HIGH	체권 is not a word. 채권 = bonds.
WHY_GOLD #3 Portfolio	낙은 상관관계	낮은 상관관계	HIGH	낙 is not a word here. 낮은 = low.
WHY_GOLD #3 Portfolio	변동성을 낙추면서도	변동성을 낮추면서도	HIGH	Same error: 낙추 should be 낮추.
WHY_GOLD #5 Scarcity	송광된 금	채광된 금	HIGH	송광 is not correct. 채광 = mined/extracted.
WHY_GOLD #5 Scarcity	송광량	채광량	HIGH	Same error: mining output should be 채광량.
WHY_GOLD #5 Scarcity	역대 총 송광량	역대 총 채광량	HIGH	Same 송광 error in stat label.
Education: what-is-gold	나눠니다	나눕니다	HIGH	Typo in conjugation. 나눕니다 = is divided.
Education: what-is-gold	체럼	처럼	HIGH	체럼 is not a word. 처럼 = like/as.
Education: what-is-gold	펜드	펀드	HIGH	펜드 is wrong. 펀드 = fund.
Education: storage-security	다이아모드	다이아몬드	MEDIUM	Missing ㄴ. 다이아몬드 = diamond.
Education: gold-pricing	유동성이 낙아	유동성이 낮아	HIGH	낙아 should be 낮아 = is low.
Education: glossary	스프레드가 좌을수록	스프레드가 좁을수록	HIGH	좌을수록 is wrong. 좁을수록 = the narrower.
Education: glossary	비용 낙지만	비용 낮지만	HIGH	낙 error again. 낮지만 = is low but.
Education: tax-legal	매각싫익	매각이익	HIGH	싫 is garbled. 이익 = profit/gain.
Home hero subtext	볳트	볼트	HIGH	볳트 is wrong. 볼트 = vault.

Search-and-Replace Shortcut: Many errors repeat the same pattern. Use these global replacements across the entire App.jsx:

- 수청 → 수천 (all instances)
- 송광 → 채광 (all instances)
- 낙은 → 낮은 | 낙아 → 낮아 | 낙추 → 낮추 | 낙지만 → 낮지만
- 체권 → 채권 | 체럼 → 처럼
- 볳트 → 볼트

- 나눴니다 → 나눕니다 | 좌을수록 → 좁을수록 | 매각싫익 → 매각이익 | 펜드 → 펀드 | 다이아모드 → 다이아몬드

2. FACTUAL & DATA ERRORS

These are errors in statistics, prices, and claims displayed on the website. All data must be verified against authoritative sources before publishing.

Location	Current	Correct	Priority	Source / Notes
WHY_GOLD #2 Safe Haven	$3,300+	$4,300+ (or ~$5,600 Jan 2026)	CRITICAL	Gold passed $3,300 in April 2025, hit $3,500 in April, $3,600 in Sep, $4,000 in Oct 2025, peaked ~$4,310 end of 2025. ATH $5,608 in Jan 2026. Source: Trading Economics, World Gold Council, BullionVault.
WHY_GOLD #2 statLabel	2025년 역대 최고가 (USD/oz)	2025년 역대 최고가 ~$4,300/oz	CRITICAL	Update the label to match corrected figure.
WHY_GOLD #5 Scarcity stat	~212,000t	~219,890t	HIGH	World Gold Council 2025 data: approximately 219,890 tonnes mined throughout history. Source: gold.org/goldhub/data/how-much-gold
WHY_GOLD #1 stat	+82%	Verify / update to ~+200%+	MEDIUM	Given gold went from ~$1,800 (2015) to $4,300+ (2025), the 10-year return is well over 100%. +82% appears outdated.
STATIC_NEWS[0]	Gold Surges Past $3,300	Update to current price level	HIGH	Dated 2026-04-11 but references $3,300 which gold passed a year earlier. Must match current market (~$4,750+).
STATIC_NEWS[0]	new all-time high above $3,300	Update: gold is trading above $4,700	HIGH	Same issue — static fallback news is stale.
WHY_GOLD_STATS	190개국 이상의 중앙은행 보유	Verify: ~80 central banks hold gold	MEDIUM	190 countries is the number of UN member states. Central banks that hold gold reserves is ~80. This stat is misleading.

Key Gold Price Timeline (2025): $3,300 (Apr) → $3,500 (Apr/May) → $3,600 (Sep) → $4,000 (Oct) → ~$4,310 (Dec 31). ATH $5,608.35 (Jan 2026). Current ~$4,751 (Apr 2026). Source: Trading Economics, World Gold Council, BullionVault.

Total Gold Mined: World Gold Council (2025): ~219,890 tonnes. Source: gold.org/goldhub/data/how-much-gold. Previous estimate of 212,000t is outdated.

Recommendation: Add a 'last verified' date to all statistics on the site. Create a /data/market-facts.js file that centralizes all quoted figures so they can be updated in one place rather than scattered across components.

3. FONT & CSS CRITICAL FIXES

The website references 4 custom fonts in JSX inline styles but NONE are actually loaded. This is the root cause of the font rendering issues across the entire Korean site.

File	Current Issue	Fix Required	Priority	Notes
index.html	No Google Fonts <link> tags	Add: Cormorant Garamond, Outfit, JetBrains Mono, Pretendard (Korean)	**CRITICAL**	ALL font-family references in JSX will fall back to system fonts. This is the #1 visual bug.
index.css :root	Default Vite CSS variables and styles	Replace entirely with Aurum brand CSS reset	**CRITICAL**	#root has width:1126px, font:18px system-ui — conflicts with App.jsx inline styles.
index.css #root	width: 1126px; max-width: 100%	Remove or set width: 100%	**CRITICAL**	This constrains the entire app to 1126px and adds borders that clash with the dark theme.
App.css	Entire file is Vite boilerplate	Delete or replace with Aurum utility classes	**HIGH**	Contains .hero, .counter, etc. — none used by the actual app.
index.css body	margin: 0 only	Add: background: #0a0a0a; font-family: Outfit, Pretendard, sans-serif	**HIGH**	Body background should match the app dark theme.
All Korean text	No Pretendard font loaded	Add Pretendard via CDN or local import	**CRITICAL**	Korean glyphs render in system fallback (Malgun Gothic / Apple SD Gothic). Brand spec requires Pretendard.
Ticker, Nav, etc.	font-family inline on every element	Extract to CSS classes for maintainability	**MEDIUM**	91KB single file with repeated inline styles. Should use CSS classes.

Required Font Import Code (add to index.html <head>)

```
<link rel="preconnect" href="https://fonts.googleapis.com">
<link
href="https://fonts.googleapis.com/css2?family=Cormorant+Garamond:wght@300;400;500;600&family=JetBrains+Mono:wg
ht@400;600;700&family=Outfit:wght@300;400;500;600;700&display=swap" rel="stylesheet">
<link rel="stylesheet"
href="https://cdn.jsdelivr.net/gh/orioncactus/pretendard/dist/web/static/pretendard.min.css">
```

Required index.css Replacement

Delete ALL existing content in index.css and replace with:

```
*, *::before, *::after { box-sizing: border-box; margin: 0; padding: 0; }
body { background: #0a0a0a; color: #f5f0e8; font-family: 'Outfit', 'Pretendard', -apple-system,
sans-serif; -webkit-font-smoothing: antialiased; }
#root { width: 100%; min-height: 100vh; }
```

4. MISSING TRANSACTION & PLATFORM PAGES

The website currently has no transaction infrastructure. These pages must be built to support a functioning e-commerce platform for precious metals. All pages should follow the existing dark theme with gold accent (#C5A572) design language.

Page / Component	Priority	Specification
Checkout Page	CRITICAL	Full checkout flow: cart summary, payment method selection (TossPay, Wire Transfer, Card), order total with fees breakdown, T&C acceptance checkbox, Place Order CTA.
Payment Processing Page	CRITICAL	Loading state while payment processes. Show order ID, expected confirmation time. Handle success/failure states.
Order Confirmation Page	CRITICAL	Post-purchase confirmation: Order ID, product details, payment method used, vault allocation confirmation, estimated vault assignment date, email/KakaoTalk notification preview.
Order History Page	HIGH	List of all past orders with status (Processing, Confirmed, Vaulted, Delivered). Filterable by date/status. Each order expandable to show full details.
Account/Profile Page	HIGH	User profile management: name, email, phone, KYC status, 2FA settings, notification preferences, linked payment methods.
KYC Verification Flow	HIGH	Multi-step identity verification: ID upload, selfie verification, address proof, status tracking (Pending/Approved/Rejected).
Vault Inventory Dashboard	HIGH	Enhanced version of current Dashboard. Should include: portfolio pie chart (gold/silver split), historical value chart, individual item cards with photos, assay certificate viewer, vault location map, insurance certificate download, audit trail.
Sell/Liquidation Flow	MEDIUM	Sell interface: select holdings, see current bid price, confirm sale, choose payout method (KRW wire, crypto, hold as credit).
Withdrawal Request Page	MEDIUM	Physical delivery request: select items, choose destination (Korea/international), calculate duties, shipping insurance, tracking.
Transaction Receipt/Invoice	MEDIUM	Downloadable PDF receipt for each transaction. Required for Korean tax reporting.

4A. Checkout Flow Specification

Step 1 — Cart Review: Display selected product(s), quantity, unit price (spot + premium breakdown), storage option selected, total in USD and KRW. Include “Edit” and “Remove” buttons.

Step 2 — Payment Selection: Three options displayed as selectable cards:

- TossPay (card/bank transfer) — instant processing, no minimum
- Wire Transfer (KRW) — for orders >$5,000, 1 business day processing
- Card Payment — Visa/Mastercard via payment processor

Step 3 — Review & Confirm: Final summary with all fees, storage fees preview (first year), terms acceptance checkbox, “Place Order” button with gold gradient.

Step 4 — Processing: Animated loading state. Show order ID immediately. Display “Payment processing...” message.

Step 5 — Confirmation: Success screen with: order ID, product details, payment receipt, vault allocation status, estimated completion, “View My Holdings” CTA.

4B. Vault Inventory Dashboard Specification

Enhanced portfolio dashboard inspired by BullionStar’s vault storage UX. Key features:

1. Portfolio Overview: Total value (USD + KRW), P&L, allocation breakdown (pie chart or bar)
2. Individual Item Cards: Product name, serial number, weight, purity, purchase date/price, current value, P&L, vault location, photo placeholder, assay certificate link
3. Vault Certificate: Generate-on-demand button. Shows: customer name, item list with serials, vault location (Malca-Amit Singapore FTZ), insurance status, date generated
4. Audit Trail: List of all actions (purchase, vault assignment, audit verification) with timestamps
5. Quick Actions: Buy More, Sell, Request Withdrawal, Download Statement
6. Insurance Badge: Always visible — “Lloyd’s of London — Fully Insured”

5. ARCHITECTURE & CODE STRUCTURE

The current codebase is a single 91KB App.jsx file with all inline styles. This must be refactored for maintainability, performance, and team collaboration.

Improvement	Priority	Specification
Component Split	CRITICAL	Break 91KB App.jsx into: /components (Nav, Ticker, Footer, ProductCard), /pages (Home, Shop, Product, Why, Storage, Learn, Dashboard, Checkout, Confirmation, Account, VaultDashboard), /data (products, articles, holdings), /hooks (useLivePrices, useNewsData, useIsMobile), /utils (formatters).
React Router	HIGH	Replace state-based navigation with react-router-dom. Enables: URL-based navigation, browser back/forward, deep linking, SEO, code splitting via lazy().
CSS Strategy	HIGH	Move from inline styles to CSS modules or Tailwind CSS. Current approach: every style is inline in JSX = unmaintainable, ~40% of file size is style objects.
Font Loading	CRITICAL	Add to index.html <head>: Google Fonts link for Cormorant Garamond, Outfit, JetBrains Mono. Add Pretendard via CDN (cdn.jsdelivr.net/gh/orioncactus/pretendard). Add font-display: swap.
State Management	MEDIUM	For transaction state (cart, orders, user session), add lightweight state: React Context + useReducer, or Zustand. Current prop drilling won't scale.
API Layer	HIGH	Create /api or /services directory. Abstract all fetch calls (prices, FX, news). Add error boundaries, retry logic, caching. Prepare endpoints for: order placement, user auth, inventory, vault data.
Payment Integration Prep	CRITICAL	Create payment service abstraction. Define interfaces for: TossPay, KakaoPay, wire transfer, card. Build webhook handler stubs for payment confirmation.
Inventory/Pricing Data Model	HIGH	Current PRODUCTS array is hardcoded. Create data model that supports: dynamic pricing from API, stock availability, product variants, category hierarchy. Prepare for CMS or admin panel connection.
i18n Framework	MEDIUM	Replace inline ternary lang checks with proper i18n (react-intl or next-intl). Current approach: every string has lang===‘ko’ ? ‘...’ : ‘...’ = fragile, hard to maintain, impossible to add 3rd language.
SEO & Meta	MEDIUM	Add: dynamic <title>, meta description, Open Graph tags, structured data (Product schema for shop items). Current site has zero SEO markup.

Recommended File Structure

```
src/
  components/  Nav.jsx  Ticker.jsx  Footer.jsx  ProductCard.jsx
  pages/  Home.jsx  Shop.jsx  Product.jsx  WhyGold.jsx  Storage.jsx
          Learn.jsx  Checkout.jsx  Confirmation.jsx  VaultDashboard.jsx
          Account.jsx  OrderHistory.jsx  KYCFlow.jsx
  data/  products.js  articles.js  holdings.js  market-facts.js
  hooks/  useLivePrices.js  useNewsData.js  useIsMobile.js  useInView.js
  utils/  formatters.js  priceCalc.js
  styles/  global.css  variables.css
  services/  api.js  payment.js  auth.js
  i18n/  ko.json  en.json
```

6. COMPETITOR VAULT STORAGE UX BENCHMARK

Summary of BullionStar's vault storage interface — the gold standard for precious metals storage UX:

- 24/7 live dashboard control: buy, sell, withdraw from same screen
- Portfolio analysis tools: allocation breakdown, historical performance charts
- Photos of stored bullion: each item inspected, photographed under camera surveillance
- Vault certificates: on-demand generation per customer
- 5 audit methods including Live Audit Report + independent LBMA-approved 3rd party auditor
- Evidence of insurance certificate from underwriter available in-app
- Multi-jurisdiction support (Singapore, US, New Zealand) from single account

Aurum Korea Approach: We don't need to replicate BullionStar's complexity. Our vault is single-location (Malca-Amit Singapore). Focus on: clean item-level cards with serial + assay cert, simple value/P&L display, one-click vault certificate generation, insurance badge always visible. Keep it minimal, premium, Korean-first UX.

7. IMPLEMENTATION PRIORITY ORDER

Recommended execution sequence for the Website Agent:

Phase 1 — HOTFIX (Immediate):

7. Add font imports to index.html (Cormorant Garamond, Outfit, JetBrains Mono, Pretendard)
8. Replace index.css with clean Aurum reset (remove Vite defaults, fix #root width)
9. Delete App.css (unused Vite boilerplate)
10. Run ALL Korean typo find-and-replace operations in App.jsx (Section 1)
11. Fix all factual errors: gold ATH, total mined gold, static news (Section 2)

Phase 2 — Transaction Infrastructure:

12. Build Checkout page (cart review → payment selection → confirm)
13. Build Order Confirmation page
14. Build Order History page
15. Enhance Dashboard into full Vault Inventory Dashboard
16. Build Account/Profile page with KYC stub

Phase 3 — Platform Polish:

17. Split App.jsx into components/pages/hooks/data structure
18. Add react-router-dom for proper URL routing
19. Implement i18n framework (replace ternary lang checks)
20. Add SEO meta tags and structured data
21. Prepare payment service abstractions for TossPay/KakaoPay integration
22. Create API service layer stubs for inventory pricing, vault data, user auth

---

END OF BRIEF — All changes are analysis and recommendations only.
Website Agent should implement. Brand Manager does not push code.
